

Case Studies

The Tyfo® Fibrwrap® Composite Systems have been used in over a 5000 projects to strengthen, upgrade and protect structures in the Asia Pacific region since 1994. These include building columns, beams, slabs, and walls; bridges, flyovers, piers, piles, chimneys, silos, water tanks, pipes and jetties. Our products have been used successfully to retrofit these structures due to aging and concrete deterioration, for increase loading, for seismic strengthening, for blast mitigation and for corrosion protection.
